Storage Control Software

Introduction

The main aim of the company was to have a basic software that controls and store its IT "Information Technology" hardware such as, PCs, monitors, printers...etc.

The software had to be easy and understandable by the end user and focused on the main points that used by stock control. For example, product description, quantities, a field that allow end user to add their own notes if needed.

About Software

The trainee has used the java language in order to create the stock control software. In addition, he has used NetBeans which consider the most used program in integrated and development environments which serve the end user and convert the high level language into simple data that can be adjustable and understandable by the end user

Operation

The software will be usable by employee that have small idea about stock and storage, the software will allow the end user to add product name and product information of any extra notes needed and finally it is quantities. The list will be saved in notepad file in order to retrieve the data again by pressing on list archive which is list all your saved products.

Another feature is you can edit on your products list for any specific item and it is also giving the end user the ability to delete any product that is in your list.

What shall be improved?

The software should have a categorization in future in order to categorize our products and assign each item to its own group such as, laptops and PC.

Search feature that can help the end user to find his product easily and it preferred to be search by category or a serial number.

Conclusion

In concluded, I believe that the trainee has complete his assigned task and the needed points that could help the company to save and control IT products and have delivered his machine language "JavaScript" to the end user clearly and obvious.
